

#TECH: Gamepad of the future

By **ETX Daily Up** - January 13, 2023 @ 12:10pm

This gamepad by Alienware is intended to replace a PC's mouse and keyboard.

AFTER presenting its Nyx concept last year, which allowed users to play PC games on any screen at home, American manufacturer Alienware is following up with an innovative gamepad prototype at CES this year.

This reinvented gamepad by Alienware is intended to replace a PC's keyboard and mouse. Above all, it offers a new experience to players.

While it may look like any other classic controller, it incorporates a fingerprint reader that makes all the difference.

This means that as soon as someone picks up the controller, it recognises the player and can immediately take them back to where they left off, or to their favourite game.

Moreover, this controller experiments with haptic feedback specially adapted to the user's preferences and the game they're playing. It allows players to feel different sensations in their hands, depending on whether they're driving a car or holding a weapon, for example. *–ETX Daily Up*
